RATIFICATION

This is to cerify the Sarjana thesis entitled

"THE CORRELATION BETWEEN EXTRAVERSION AND SELF CONFIDENCE TOWARD SPEAKING ABILITY AT THE THIRD GRADE STUDENTS OF MAN 2 KARANGANYAR IN THE ACADEMIC YEAR OF 2022/2023" by Muchamad Harun Alrosjid (173221168) has been approved by the board of thesis examiners as the requirement for the degree of Sarjana in English Language Education Study Program.

PRONOUNCMENT

Name : Muchamad Harun Alrosjid

SRN : 173221168

Study program : English Education

Faculty : Language and Culture Faculty

I hereby sincerely state that the thesis titled "THE CORRELATION BETWEEN EXTRAVERSION AND SELF CONFIDENCE TOWARD SPEAKING ABILITY AT THE THIRD GRADE STUDENTS OF MAN 2 KARANGANYAR IN THE ACADEMIC YEAR OF 2022/2023"

Is a real masterpiece. The things out of my masterpiece in this thesis are signed by citation and referred to in the bibliography. If later proven that my thesis has discrepancies, I am willing to take academic sanctions in the form of repealing my thesis and academic degree.

ACKNOWLEDGEMENT

Alhamdulilah, all praises be to Allah SWT, the single power, the lord of the universe, master of the day of judgment, God, for all the blessing and mercies so the researcher was able to finish this thesis entitled "The Correlation Between Extraversion and Self-confidence Toward Speaking ability at The Third Grade Students of MAN 2 Karanganyar in The Academic Year of 2022/2023" Peace and salutation always be given to our prophet Muhammad SAW who brought us from the darkness to the brightness. The researcher is sure that this thesis would not be completed without help, supports, and suggestions from several sides. Thus, the researcher would say his deepest thanks to all who have giving helped, supported, and suggested him in the provessing of writing this thesis. This goes to:

- Prof. Dr. H. Mudhofir, S.Ag., M.Pd., as the Rector of Raden Mas Said State Islamic University of Surakarta.
- Prof. Dr. Toto Suharto, S.Ag., M.Ag. as the Dean of Cultures and Languages Faculty.
- Wildan Mahir Muttaqin, M. A. TESL., as the Coordinator of English Language Education of Cultures and Languages Faculty.
- 4. Prof. Dr. H. Sujito, M.Pd., as the advisor for his guidance, advice, correction, and help to revise the mistake during the entire process of writing this thesis.
- All lectures of English Language Education especially Sabariyanto, M.Pd and Muh. Husin Al Fatah, M.Pd., as examiners in this thesis. Thanks for the suggestion, guidance, advice, and share knowledge with me.

The researcher realizes that this thesis is stil far from being perfect. The researcher hopes that this thesis is useful for the researcher in particular and the reader in general.

Sukoharjo, April 6th 2023

The researcher,

Muchamad Harun Alrosjid

ABSTRACT

Muchamad Harun Alrosjid. 2023. "The Correlation Between Extraversion and Selfconfidence Toward Speaking ability at The Third Grade Students of MAN 2 Karanganyar in The Academic Year of 2022/2023". Thesis. English Language Education Program. Faculty of Cultures and Languages. Raden Mas Said State Islamic University of Surakarta.

Advisor : Prof. Dr. H. Sujito, M.Pd.

The key word : Extraversion, Self-confidence, Speaking Ability

The objectives of this this research are to find out the correlation between (1) Extraversion and Speaking Ability of the third grade students of MAN 2 Karanganyar in the academic year of 2022/2023, (2) Self-confidence and speaking ability of the third grade students of MAN 2 Karanganyar in the academic year of 2022/2023, (3) Extraversion and self-confidence toward speaking ability of the third grade students of MAN 2 Karanganyar in the academic year of 2022/2023, (3)

The research method was a quantitative correlation research. The population of this research are all of the third grade students of MAN 2 Karanganyar in the academic year 2022/2023. Consist of 210 students and it consist of seven classes namely XII IPA 1, XII IPA 2, XII IPA 3, XII IPS 1, XII IPS 2, XII PK 1, and XII PK 2. The total number of students' was 210 students. The samples of research consist of 42 students. The sampling technique used is simple random sampling. The techniques of collecting data are: questionnaires and documentation. The questionnaire to extraversion and self-confidence and the documentation is for speaking ability. The techniques which were used to analyze data was Simple Correlation and Multiple Linear Regression Correlation which were computed by the Statistical Product and Service Solution (SPSS).

The result of the study show that (1) there is no positive significant correlation between extraversion and speaking ability because the coefficient of correlation robtained is lower than r-table (-0.122 < 0.304); (2) there is a positive significant correlation between self-confidence and speaking ability because the coefficient of correlation r-obtained is higher than r-table (0.438 > 0.304); (3) there is a positive significant correlation between extraversion and self-confidence toward speaking ability because the coefficient of correlation r-obtained is higher than r-table (0.440 > 0.304). The result of this research shows that extraversion and self-confidence is important factors that give contribution to student's speaking ability.

CHAPTER I

INTRODUCTION

A. Background of the Study

Nowadays, English speaking ability is an important skill to learn because of the large amount of information that uses English. English language is the first language that is taught form junior high school until in university. For student English language learners, there are 4 skills that students should be mastered. Speaking is one of those skills, speaking fluently and precisely plays an important role in learning a foreign language. The more fluent and correct the students in speaking English, the better the score they get in the speaking test.

English learning has a standard level that must be achieved by students. In Permendikbudristek No. 5 Article 3 of 2022 it is explained, the graduation competency standard is used as a guide in determining the graduation of students from educational units. And at the end of junior high school the standard of competence of students is expected to be able to reach the level that students be able to demonstrate speaking ability in Indonesian and simple English. It seems that students at the end of junior high school should reach an adequate level of communicative competence at that level. However, it is not easy to meet these standards. The same thing was seen in the third grade students of MAN 2 Karanganyar.

Cameron (2001:40) Speaking is using language actively to express meaning to others orally. Then he also added that by expressing the meaning that other people can understand them. In speaking it is necessary to use the right sentence or words and with the correct grammatical arrangement to be able to give the right meaning to the listener, so that they understand what we are saying. Another definition Bashir (2011:38) states that speaking is a skill which is necessary to produce an utterance or sentence in oral form. According to him, this skill has more difficulty than other skills, because this skill does not only express words. Speaking is a skill that poses a challenge to most English learners. This skill is one of the skills that can be used as a measure of how successful someone is in learning English.

There are many students who have studied English for quite a long time from elementary to high school, but many also get high scores in grammar or in written tests of English. But it turns out that many are still weak to speak English well and fluently. Maybe because they can understand what they write and read but they still have difficulty expressing it verbally. Utama et al (2013:3) States that there are two aspects in being successful in speaking skill, first linguistic aspects such as grammar, word order, pronunciation, speech comprehension, vocabulary, and fluency, then non-linguistic aspects such as self-esteem, extraversion, motivation, intergroup climate, and self-confidence. From the statement above we can conclude that speaking ability is not only influenced by knowledge and experience but also influenced by on self-confidence and personality.

Speaking is an act of speaking that can be influenced by many things, one of which is described above. Dornyei, Clement, and Noels (1994) states selfconfidence significantly contributes to the learner's willingness to communicate in a foreign language. According to them, affective factors such as motivation, selfconfidence, personality, and self-esteem underlie the willingness to communicate. So in language learning activities, there are non-linguistic aspects that have an impact on a person's success in speaking English related to self-confidence, or human personality such as extroverts.

Brown (2000:62) States that self-confidence is students' belief that they can do the task or complete it with the abilities they have. Self-confidence is an important factor that provides understanding in the achievement of foreign language learning. Some studies say that language learning activities will not be successful without self-confidence. In everyday life self-confidence has an important role in getting things done, a person's lack of self-confidence can cause doubt and uncertainty in completing tasks or doing something. According to Heyde in Lee and park (2004:199) Self-confidence has an important role in communicating, students' willingness to speak is in self-confidence. Therefore selfconfidence has an influence on speaking ability. High self-confidence has a positive relationship with oral performance.

Extroverted personality is a non-linguistic aspect for success in speaking ability. Eysenck in Bullock and Gilliland (1993) states that Extroverts seek happiness from social activities to get or increase their natural arousal which is low for extroverts, whereas introverts tend to avoid social situations or activities to avoid their natural arousal levels too far. A number of personality characteristics have been proposed as possible influences on foreign language learning or second language learning. Which extraversion is included in, extraversion is a social personality that looks, likes to get along, a good conversationalist and is socially active. Extrovert personality is the opposite of introverted personality, introverted personality is the personality of someone who is less sociable, talks little, and is comfortable when alone. They have little involvement in social activities or activities that involve their activeness in social activities that interact with many people. These personality differences between introverts and extroverts in socializing then affect the ability to speak. The intuitive hypothesis of the above statement is that extroverted students learn more quickly than introverts. This is because extroverted students find it easier to make contact with other second language users, therefore they get more input.

This research was conducted on students in the third grade students of MAN 2 Karanganyar. Based on pre-observation of the researcher, at the third grade students of MAN 2 Karanganyar. Researchers found some problems related to speaking English. First, in speaking English students are not fluent because they are afraid that they will make mistakes when practicing speaking English, it can be seen from their answers when asked in English by the teacher, and make mistakes when practicing speaking speaking a simple sentence. Second students have difficulty in expressing words or sentences, then the students are less confident when practicing speaking English, they show hesitation and anxiety when speaking English, and there is a lack of grammar marked by an error in speaking English, of course there will be obstacles when students have difficulty in speaking English, if these problems are allowed, this can cause obstacles or not smooth the learning process in English class.

Previous research from Hariswan et al (2022) in "Speaking Performance and Problems Faced by English Major Students at a University in South Sumatra" the finding showed that 42% of the participants did well and 58% did not perform well in the speaking test. From this research it was found that the factors causing the speaking abilities are fear of mistakes, lack of knowledge, nervousness, and self-confidence.

Research conducted by Rifansah (2020) in "The Correlation Among Self-Confidence, Self-Esteem and Speaking Achievement at The Third Semester of IAIN Palangka Raya" in his findings, there is a high relationship between selfconfidence and self-esteem toward Speaking Achievement. After looking at some of the previous findings. The writer is interested in conducting research on extraversion and self-confidence which can affect students' speaking skills to find out the relationship between the three variables.

In this study, the researchers aimed to determine a significant relationship between extraversion, self-confidence and speaking skills from questionnaires and documents from the third grade students of MAN 2 Karanganyar as participants in this study. Therefore, the researcher estimates that by distributing the questionnaires it may be useful to know the results. Therefore, researchers are interested in choosing the title "THE CORRELATION BETWEEN EXTRAVERSION AND SELF CONFIDENCE TOWARD SPEAKING ABILIITY AT THE THIRD GRADE STUDENTS OF MAN 2 KARANGNYAR IN THE ACADEMIC YEAR OF 2022/2023".

B. Identification of the Problems

From the research background, the researcher identifies why students have difficulties in speaking English in the third grade students of MAN 2 Karanganyar.

- 1. Students' fear of negative responses when speaking in English at the third grade students of MAN 2 Karanganyar in the Academic year of 2022/2023.
- 2. Students have difficulty in expressing words or sentences at the third grade students of MAN 2 Karanganyar in the Academic year of 2022/2023.
- 3. The important role of students' extraversion and self-confidence on speaking ability at the third grade students of MAN 2 Karanganyar in the Academic year of 2022/2023.
- 4. Students' extraversion correlates toward speaking ability at the third grade students of MAN 2 Karanganyar in the Academic year of 2022/2023.
- 5. Students' self-confidence correlates toward speaking ability at the third grade students of MAN 2 Karanganyar in the Academic year of 2022/2023.

C. Limitation of the Problems

The writer limits the research to the third grade students of MAN 2 Karanganyar. This research conducted to find out whether or not there is a correlation between extraversion, and self-confidence towards speaking ability.

D. Formulation of the Problems

- 1. Is there any significant positive correlation between extraversion and speaking ability in the third grade students of MAN 2 Karanganyar 2022/2023?
- 2. Is there any significant positive correlation between self-confidence and speaking ability in the third grade students of MAN 2 Karanganyar 2022/2023?
- 3. Is there any significant positive correlation between extraversion, and selfconfidence toward speaking ability in the third grade students of MAN 2 Karanganyar 2022/2023?

E. Objectives of the Study

- 1. To find whether there is a significant correlation between extraversion and speaking ability in the third grade students of MAN 2 Karanganyar 2022/2023.
- 2. To find whether there is a significant correlation between self-confidence and speaking ability in the third grade students of MAN 2 Karanganyar 2022/2023.
- To find whether there is a significant correlation between extraversion, and self-confidence toward speaking ability in the third grade students of MAN 2 Karanganyar 2022/2023.

F. Benefits of the Study

There are several benefits that will be obtained through this research. The benefits of the study are as follows:

1. Theoretically Benefit

This study provides a description of the relationship between extraversion, self-confidence, and speaking ability. This research is expected to provide useful knowledge related to extraversion, self-confidence toward speaking ability.

- 2. Practical Benefit
 - a. For the students

This study may help students to be aware of the influence of nonlinguistic aspects such as self-confidence and extraversion so that they can find the best way to solve their problems in speaking.

b. Teachers

The result of this study may help the teachers in improving their methods in the learning process. so that the problems faced by students and teachers in the teaching and learning process can be minimized. besides that the teacher can apply the right method in the class to make learning more interesting and fun for both extroverts and introverts.

c. For the other researcher

The result of this study might be useful to provide a useful description for any further researcher who wants to study the same case, hopefully, this study source of information and reference.

G. Definition of Key Terms

In this section, the researcher briefly provides definitions of key terms to make the meaning understandable. The author conveys that in order to avoid misinterpretation of the title of this research, the author would like to clarify and explain the terms used.

1. Speaking Ability

Speaking ability is the ability of students to express their ideas or thoughts orally fluently with the right vocabulary and good pronunciation or being able to show it with a speaking score. Fernanda (2015:5)

2. Extraversion

Extraversion refers to where people prefer to focus their attention and get their energy from the outer world of people and activity or their inner world of ideas and experiences. Dörnyei (2005:19)

3. Self-confidence

States that self-confidence is students' belief that they can do the task or complete it with the abilities they have. Brown (2000:62)

CHAPTER II

REVIEW ON RELATED LITERATURE

This section will describe an overview of the relevant theories used in this research. This chapter discusses the following subtopics: definitions of extraversion, self-confidence, and speaking ability.

A. Theoretical Review

- 1. Speaking Ability
 - a. The Definition of Speaking Ability

Speaking is an important skill in communication, it is an activity to communicate with other people that is done every day. Besides making it easier for student to communicate with other people, speaking English makes it easy to adapt to the global world, such as education, business, and technology. In learning speaking English, students are expected to be able to master the four basic skills, speaking is one of the four language skills (reading, writing, listening, and speaking). Harmer (2007:284) states speaking is the ability to speak fluently and presupposes not only knowledge of language features, but also the ability to process information and language on the spot. We can conclude that speaking is expressing thoughts, ideas, and information using speaking skills in arranging words into phrases or sentences to choose the right words related to the topic of conversation. It is a means through which learners can communicate with others to achieve certain goals or to express their opinions, intentions, hopes, and points of view. (Chaney, 1998, p. 13 as cited in Ilham, 2020), Says that "speaking is the process of building and sharing meaning through the use of verbal and nonverbal symbols, in a variety of contexts." it can be concluded that speaking is a means to convey ideas or exchange information and its purpose is to create communication with the other people for certain purpose.

Mastery of speaking skills in English is a priority for many second or foreign language learners. In addition, speaking is an oral language skill and a complex language skill involving listening skills, knowledge and pronunciation, grammar, vocabulary, and culture. Speaking is also used for many purposes, and each purpose involves a different skill. In some situations, many people use speaking to give instructions or get things done. They use speaking to describe something, to complain about people's behavior, to make polite requests, or to entertain people with jokes.

Mirosław Pawlak, Kalisz (2021:7), States that "speaking is an extremely complex, multifaceted skill, adept use of which requires sufficient mastery of linguistic resources in terms of grammar, vocabulary and pronunciation, awareness of pragmatic conventions, familiarity with culture- specific rules of discourse, the capacity for managing the conversation, or the ability to tackle problems which may arise in interaction through the use of various communication." Different from other basic skills, speaking is a skill that is done orally, which means we can immediately listen to it. Speaking is not just relying on the ability to speak, but requires the ability to process words and listen so that the conversation is well established. According to Brown (2004:140), States that "speaking is a productive skill that can be directly and empirically observed those observations are invariably colored by the accuracy and effectiveness of a test taker's listening skill, which inevitably compromises the reliability and the validity of an oral production test."

From the definition above definition the writer concludes that speaking is one of the four English skills to express our opinions, ideas, thoughts, feelings and others, by speaking people can communicate with each other so people, especially students, must master these skills. because it is a very important spoken skill for second language learners or foreign language learners to communicate in their life. Without speaking we cannot express what we want to express and that makes it difficult for people to communicate with others and will lead to bad relationships.

b. The Aims of Speaking

The main purpose of speaking is to communicate. Speaking is a important tool to communicate or to deliver information about what the speaker will be said with their society. Therefore, speaking is very important. Basically, there are three important aims of speaking according to Tarigan (2008:30) as follows:

1) To inform

Means that the speaker is willing to tell or share information, feelings or opinions of the speaker to the listener and convey certain knowledge, or goals. Informative speaking style has the aim of providing information to decide something, explain the process, or explain style, and also writing techniques. We often encounter this speaking technique in classroom learning, such as a teacher explaining the subject matter to his students, or a friend who tells his vacation experience, or a parent who teaches good things to his child.

2) To entertain

Entertaining here means that the speaker tries or wants to make the listener feel happy or entertained by what the speaker says on its entertainment value. For example, when a lecturer tells his students about a funny story, or a friend tells an interesting story that makes his theme happy. by having this conversation, speaking becomes interesting for the other person to hear. In this case, the speaker can use the best way to get the good attention of the listener when they hear what the speaker is saying.

3) To persuade

Meaning that speaking with the aim of persuading is used by the speaker when the speaker wants to convince the listener to do something in a certain activity. it requires action to get the listener interested in doing what the speaker wants. Usually speaking this type is often used in terms of buying and selling an item where the seller tries to convince the buyer to buy the item he is selling. Other examples include parents who advise their children to study hard so they don't have trouble at school.

4) To discuss

This means that the speaker is trying to discuss something to decide something or do what will be done or planned next. When the speaker invites the listeners to discuss, this speaking activity is often done, for example when parents discuss with their children which school their child will choose next, other examples such as friends on vacation and talking about the desired vacation place. to visit.

c. The Aspects of Speaking

To be able to use the target language well, knowing about the language itself is not enough, but there are several other things that a foreign language learner must master. Things like knowledge of how to choose the right sentences according to the social circumstances around him, how to start, respond to, and end conversations, and how to flow a good conversation with. In speaking, there are several aspects that must be fulfilled by the learner. This can be used as a measure of whether or not our speech is good. Those aspects are: fluency, pronunciation, vocabulary and accuracy. according to Brown in Saputra (2020) The description is as follows:

1) Fluency

According too Kayi, (2006:1) defines speaking as the use of language quickly and confidently with few unnatural pauses, which is called fluency. It means that fluency is the fluency of the speaker who does not experience difficulties when speaking such as confused choosing words, or difficulty expressing sentences when speaking to listeners. More recent studies of fluency adopt Lennon's Jamatlou (2011:11) fluency such as fast, accurate, clear, and efficient translation or communicative intent into language under the temporal constraints of online processing.

2) Vocabulary

Vocabulary exists in every language. Vocabulary is very important in choosing the right words to say in the context of speaking so that conversation is easy. Difficult. when we speak generally we will choose words that are easy to understand so that listeners understand what we are saying. For example, such as a doctor who explains the illness suffered by his patient, or a teacher who explains the subject matter in words that are easily understood by his students.

3) Pronunciation

Good pronunciation is very important for someone who wants to speak. Good and correct pronunciation will make it easier for listeners to understand the meaning of what the speaker is saying. mispronunciation usually occurs in the pronunciation of words that are rarely spoken or words that are similar to other words such as war, evening, shells, light. but this can be avoided by paying attention to the context.

4) Accuracy

According to (Nunan, 2015, p. 54) Accuracy in speaking refers to how well the speaker's speech can be received. For example, a speech or lecture can be received by the listener from the right choice of words, clear pronunciation, and proper grammar with the context of the conversation, so that the meaning of the speech is conveyed properly.

d. Problem in Speaking

Speaking as productive skill have a lot of components that should be mastered by the students. As long most of Indonesian students still encountered English as foreign language, they will face some of difficulties to be a good speaker in English. They get difficulties in several components such as pronunciation, grammar, diction, and fluency on speaking English. According to pollard in Azlina et al (2015:2) "Speaking is one of the most difficult aspects for students to master." For students who wants to speak English fluently may not be as easy as we think, there are several main problems in learning to practice speaking English, from the results of research by Rahayu et al (2020) Her research is to examine what problems are faced by EFL Colleges Learners in speaking English. The findings showed that there are four main problems related to EFL Colleges Learner learner in speaking English, including: (1) lack of Vocabulary, (2) Grammar is not well Mastered, (3) Fear of negative responses from others, and (4) Low selfconfidence in speaking English."

From her research it can be concluded that linguistic matters such as grammar, vocabulary and non-linguistics such as self-confidence do indeed affect a person's speaking ability. This is proven by his findings.

In general, there are several things that make speaking English difficult. According to Brown (2001:270) suggested some causes that make speaking difficult as follows:

1) Clustering

fluent speaking is through phrasals so it is not generated word for word or stringing single words. Learners can manage their output both cognitively and physically. while students who speak by arranging word for word and not grouping it into a phrase or sentence will make it less fluent when speaking.

2) Redundancy

Redundancy is a grammar that can predict its meaning. The speaker has the opportunity to make meaning clearer through redundancy. For example, when someone talks about something, they try to make words easier to understand such as "the reason why becomes reason" or "each and every becomes each". 3) Reduced Forms

Reduced forms is a change in the pronunciation of a word or phrase when a native speaker speaks at a normal speed. Reduced forms are words that are not written in English but are often used by native speakers. It's important to be able to recognize them so you can understand spoken English and sound more natural when you speak. Here are some of the most useful reduced forms to know about. Gonna, gotta, wanna, oughta = going to, got to, want to, ought to ("I'm gonna go to the store.") 'Cuz = because

4) Performance Variables

One of the advantages of spoken language is that when the thought process when speaking, for example when hesitating or pausing, can be filled with a tone when thinking about something like ub, um, well, you know, I mean, like, etc. This style of speaking while thinking is often used when someone is being asked something or discussing something that makes them think for a moment before answering the question.

5) Colloquial Language

Unfamiliar words such as idioms, phrases and colloquial slang can also make it difficult to speak English. For example, when we talk to close relatives using familiar words like cuz = because, yea = yes, i dunno = i dont know. 6) Rate of Delivery

A speech rate that is less than generally acceptable is also a sign of difficulty speaking English. Lack of speed in speaking can also be caused by various things such as lack of vocabulary or phrases, and is also caused by the habit of using the mother tongue.

7) Stress, Rhythm, and Intonation

The next difficulty in speaking English is having the pronunciation or rhythm of time in speaking, the right emphasis and intonation patterns make it easier for listeners to catch the meaning of the conversation. we can find emphasis or rhythm in speaking in everyday conversation.

8) Interaction

Lack of interaction in speaking English with the other person speaking will lack skills in speaking such as creativity in conversational negotiations. for example, when someone rarely talks to other people or socializes or is introverted they tend to rarely communicate with other people which makes them less proficient in replying to conversations when talking, for example when a seller who often sells will be proficient in offering his wares.

Therefore the lack of the things above makes speaking difficult to learn especially for students who are trying to learn English as their second language at educational unit. e. Types of Classroom Speaking Performance

According to (Brown, 2000, p. 271), there are six types of oral production that students are expected to do in class, namely imitative, intensive, responsive, transactional, interpersonal, and extensive. The types of speaking are as follows:

1) Imitative

Imitative means a type of speaking performance, namely the ability to simply repeat or imitate a word or phrase, maybe even a sentence. For example, in class a teacher asks students to repeat English sentences that the teacher says or reads.

2) Intensive

Intensive is the second type of speaking that is often used in assessment contexts is the production of short spoken language designed to demonstrate competence that includes in grammatical, phrasal, lexical, or phonological relationships. For example, a teacher asks students to read a passage to say in English or students respond directly to a simple question.

3) Responsive

Means testing students with interaction or conversation with understanding but a little limited to very short conversations, for example such as greetings, standards, small talk, simple requests and comments. For example, a teacher asks students to practice simple conversations according to the material being taught in class.

4) Transactional

This transactional nature is a negotiation based on the exchange of information and delivery of opinions in the form of dialogue. This type of speaking practice in class can be done in pairs or in group work.

5) Interpersonal

Interpersonal practice can maintain social relationships. Interpersonal dialogue is a little complicated for students to decipher because it has slang or everyday slang. However this type of practice allows students to learn language in class in real contexts and leads to learner fluency.

6) Extensive

Extensive (monologue), This extensive oral production task includes speech, oral presentation, and storytelling, where on this occasion verbal interaction from the listener is very limited (possibly for nonverbal responses) or sometimes excluded altogether. This speaking activity involves a lot of preparation and is usually not improvised communication.

There are 6 forms of Speaking Performance that can be done in class to improve speaking skills. Given this, speaking has been seen as a tool for communicating, thinking, and learning language. Through Speaking Performance, learners can expand their vocabulary, learn concepts, and express their ideas fluently.

f. Characteristic of Success Speaking Activity

According to Brown (2001) said that spoken language is easy to perform but in some cases, it is a difficult. In order to that they can carry out the successful speaking activity as:

- Students have a lot of time given for student speaking activities. maybe this is already obvious but sometimes the teacher spends time to pause or talk the teacher.
- 2) All students get an equal turn in speaking activities
- 3) Students have high motivation and are eager to talk
- 4) The language that learners use at an acceptable level, that is, they can be understood by each other with relevant speech with acceptable language accuracy.

Considering speaking is one of the difficult skills for second language students to learn. it is important for students to have the motivation to speak and be able to practice or use sufficient opportunities to be successful in speaking activities.
2. Extraversion

a. Definition of Extraversion

Feist & Gregory (2011:122). States that we can observe this extraversion with the condition of someone who is easy to get along with, active in conversation, likes to hang out together and is cheerful. This is due to the tendency of an extrovert who is more active than an introvert who is shy and less sociable.

It means that extraversion is a temperament, an aspect of personality that exists in humans which is a factor of heredity. This aspect can be found in every human being, which means this extraversion has existed since humans were born in the world and continues to go along with human growth.

Eysenck in Bullock and Gilliland (1993) states that Extroverts seek happiness from social activities to get or increase their natural arousal which is low for extroverts, whereas introverts tend to avoid social situations or activities to avoid their natural arousal levels too far. Eysenck was one of the first to try to describe the core features of the extraversion and developed scales to assess personality.

In conclusion extrovert is a personality condition of someone who will get energy when doing social activities or meeting other people while introverts are the opposite. b. The Characteristic of Extraversion

Extraversion traits are found in the big five personality, the big five personality is the five major dimensions of personality based on Allport and Cattell. Allport and Cattell assume that humans are composed of five traits, but only one dimension dominates.

Revelle (2015:3) States that extraversion has several characteristics such as talkative, assertive, active, and energetic and then for the opposite, quiet, reserved, shy, and silent. This statement also strengthened by Dörnyei (2005) states that extroverts talk more and use fewer pauses than introverts. From the habits of an extrovert described above, it can be concluded that an extroverts have advantages in terms of verbal and sociable while introverts prefer to be alone.

From the habits of an extrovert that have been described above, it can be concluded that an extrovert has advantages in terms of verbal and sociable while introverts prefer to be alone. Therefore an extrovert personality will talk more with other people compared to introverts.

c. The Cause of Extraversion

According to Eysenck in Feist & Gregory (2011:124) Extroverts are caused by chronic levels of stimulation which are mostly genetically inherited rather than learned.

It means that extrovert personality already exists genetically, so since birth a human being has an extrovert level in them.

the statement above is also reinforced by Johnson et al (1999:252), A study found that introverts have blood flow in the lobes of their brain and the anterior or frontal thalamus, which is an area associated with internal processing, such as planning and problem solving, whereas extraverts have more blood flow in the anterior cingulate gyrus, the lobe of the brain. Temporal, and posterior thalamus, which are involved in sensory and emotional experiences. This study also shows that there are individual differences in brain function in introverts or extroverts.

This explains that an extrovert who has a way or pattern of thinking that is different from an introvert comes from genetics which is characterized by more blood flow in certain parts of the brain that are different both extroverts and introverts..

d. The Relationship of Extraversion and Speaking Ability

Tuan and Mai (2015), the speaking ability of students can be influenced by various factors such as the workplace, affective factors, listening skills, and feedback. If we connect extraversion with learning activities second language, then both extroverted and introverted personalities will have advantages in different aspects.

According to Kawczynski in Robert (1985: 32), suggests that both introversion and extroversion have success in learning a second language but in different types of language programs. This statement shows that both introverts and extroverts have advantages in their respective fields. Dewaele & Furnham, (2000: 355) According to him, a study found that extraverts were found to be more fluent in verbal matters such as conversation, extraverts were found to be more fluent than introverts in both L1 and L2. The authors explain that introverts can have increased stress if their arousal level exceeds their optimal level, which hinders their speech production activities, so that their speaking ability becomes not fluent. As a result, their speech slows down their hesitate more often, they tend to make more mistakes, and they are unable to produce long speech.

e. Extraversion indicators

According to John et al., (2008:18) he divides extraversion into several factors including at least five distinguishable components: activity level (active, energetic), dominance (assertive, forceful, bossy), sociability (outgoing, sociable, talkative), expressiveness (adventurous, outspoken, noisy, show-off), and positive emotionality (enthusiastic, spunky).

It seems that a person can be said to be an extrovert if in a person one can be found with the factors above. Therefore a person's level of extraversion can be measured by several of these factors.

3. Self-Confidence

a. The Definition of Self-confidence

Self-confidence is an impetus for humans to be confident in their ability to get things done, when someone masters something or has experience completing something they tend to have confidence in that person when they are about to do it, this makes sense because they already know what they are doing which must be done right, and that's why selfconfidence is present in them. McPheat (2010:14) States that Selfconfidence can be boiled down to the belief that a person has it in their ability to succeed at a task, based on whether or not they have been able to perform the task in the past. Generally, every student will have confidence in doing or completing something if they already have the ability or have been prepared to face something. Self-confidence is a belief or selfawareness of their ability to do or get things done. According to Brown in Salim (2015:36) "defines general self-confidence as how you feel about yourself and your abilities." According to the statement above, we can conclude that we can feel self-confidence when we are about to face something, whether we believe we can solve it or not. Tripathy & Srivastava in Akbari & Sahibzada (2020), believe that self-confidence is an attitude and students confidently believe in their abilities to do something. They believe they can achieve a goal or get something done. From the definition above self-confidence can be summarized as the belief that a person has the ability and is confident in his ability to succeed in a task or not. Therefore someone with self-confidence will be sure of their ability to get things done because they have the skills or experience in them

b. The Factors that Affect Confidence

There are several factors that affect self-confidence in a person, there are factors that are different for each person and some are the same depending on the condition of each individual. The results of research by Putri (2018) shows that 'students with low confidence, higher anxiety, and low motivation have serious difficulties in speaking in spite of having acceptable linguistic knowledge.' Students will have difficulty speaking with a lack of self-confidence which results in anxiety, less motivated especially in terms of learning to speak English.

McPheat, (2010:14), States that "there are actually two aspects of self-confidence. The first is competence, whether or not you have the necessary skills and abilities to complete a task. The second is self-assurance and whether or not you believe that you have the ability to complete the task."

Pearson will have low self-confidence if they are lacking in their abilities or skills so they will lack confidence when facing a task, but someone can be confident even though they have less ability but they have strong beliefs

c. Self-confidence indicators

Self-confidence is a trait possessed by a person with a sense of trust and confidence in the abilities that are in him. So that all plans in life can be planned properly. People who have self-confidence can also be said to be someone who knows about their abilities and can use their abilities to do something. Confident people want to hear what other people have to say in the form of input that can make themselves better.

There are several forms of self-confidence according to Goleman (1999) such as, dare to appear with self-confidence or dare to state "its existence", dare to voice unpopular views, Willing to sacrifice, firm; able to make good decisions even in conditions of uncertainty and stress.

There are several indicators to measure self-confidence in a person, self-confidence indicator according to Goleman (1999) divided into seven indicators, as follows:

- 1) Optimistic
- 2) Self respect
- 3) not afraid/hesitating
- 4) Dare to come up with new ideas
- 5) Dare to ask/answer
- 6) Placid
- 7) Ability in social relations

It seems that a person can be said to have self-confidence if in a person can be found the factors above. Therefore a person's level of selfconfidence can be measured by several of these factors.

B. Previous Related Study

In the previous related studies, the researcher presents the previous study dealing with the topic. The first previous research comes from Muhamad Fikri Nadzif (2015), "THE CORRELATION BETWEEN EXTROVERSION AND SPAKING SKILL IN ENGLISH EDUCATION DEPARTMENT STUDENTS". In this study, we want to find out the relationship between the personality trait of extroversion and English speaking skills. The study was conducted at English Education Department of UIN Walisongo Semarang. The subjects of this study were students of basic speaking class. This study aims to determine the relationship between variables, and this study uses the person product moment correlation. The data in this study were collected through questionnaires, tests, interviews, and documentation. The results of this study indicate that there is a significant relationship between students' personality trait and English speaking ability of basic speaking class. Having calculated by Pearson Product Moment Correlation formula, r table with 5% significance level was 0.367, rxy was 0.500. rxy was bigger than r table, therefore the correlation was significant.

The second previous research comes from Syahril Rifansah (2020), "THE CORRELATION AMONG SELF CONFIDENCE, SELF ESTEEM AND SPEAKING ACHIEVEMENT AT THE THIRD SEMESTER OF IAIN PALANGKARAYA". The type of this research is quantitative, the purpose of this study is to determine the relationship between self-confidence, self-esteem and speaking ability of third semester students of English study program at IAIN Palangka Raya. This study focuses on finding out the relationship between selfconfidence, self-esteem and speaking ability. In collecting data, this study used questionnaires and speaking tests for students. The research population is the third semester students of the English study program at IAIN Palangka Raya. The sampling method in this research is total sampling. The technique of collecting data on students' self-confidence and self-esteem uses a questionnaire. The technique of collecting data on speaking skills uses a speaking test for students. The data analysis technique used Pearson product moment correlation.

The third previous research comes from Syahril Rifansah (2020), "THE CORRELATION BETWEEN INTROVERT-EXTROVERT PERSONALITY AND STUDENTS' SPEAKING ABILITY: META-ANALYSIS". This study aims to determine the possibility of a significant relationship between introvert-extrovert personality on the performance of students' speaking skills. The method used in this research is meta-analysis. The data collected is calculated statistically by jamovi. The results of this study show the correlation between introverted extrovert personality and speaking ability performance of 1.27 which shows a high relationship between these variables. The study also found that extroverts talk better than introverts. Concluded that introvert and extrovert personality affect the performance of students' English speaking skills.

The last previous research comes from Kadek Dwi Cahyani, IMade Sutama, and Iwayan Rasna (2020), "EFFECT OF PERSONALITY ON SPEKAING AKILLS OF LANGUAGE DEPARTEMENT IN SMA NEGERI 1 SAWAN". This study aims to determine the impact of personality on speaking skills in the language department at SMA Negeri 1 Sawan. The population in this study were 106 students from 3 classes. Sampling technique is done by purposive sampling method. The total number of samples in this study was 70 students consisting of 30 introverted students and 40 extroverted students. This study uses the Ex Post Facto method. The collected data were analyzed using T-test and the significance level was +0.005. Data collection was carried out using questionnaires and tests. The results of this study indicate that there is an influence of personality on students' speaking skills, with a significance value of 0.000 less than 0.005 seen from the average value of extroverted students' speaking skills is 83.47 while the average value of introverted students' speaking skills is 79.60. So, H0 is rejected and H1 is accepted

C. Rationale

1. Correlation between self-confidence and speaking ability

According to Goleman in Mieke (2006:30), self-confidence is a belief in one's own abilities. This means that people who are not confident will feel unsure and nervous when practicing their abilities such as speaking. Tripathy & Srivastava in Akbari & Sahibzada (2020), believe that self-confidence is an attitude and students confidently believe in their abilities to do something. They believe they can achieve a goal or get something done. From the definition above Self-confidence can be summarized as the belief that a person has the ability and is confident in his ability to succeed in a task or not. 2. Correlation between extraversion and speaking ability

Dewaele and Furnham dalam Dörnyei (2005:26), according to him, extrovert personality in verbal matters such as conversation, extravert is more fluent than introvert in both L1 and L2. This shows that there is a relationship between the extravert personality and the ability to speak in both L1 and L2 languages. It is possible that extraverts have more opportunities to talk and get more feedback than introverts, which makes extroverts has better speaking skills than introverts.

3. Correlation among self-confidence and extraversion toward speaking ability.

Students who have an extroverted personality have more opportunities to speak which makes them get a lot of feedback from other people or teachers which makes them better in terms of verbal skills such as speaking both L1 and L2. Dewaele and Furnham in a study found that extravert is more fluent than introvert in both L1 and L2. Even though fluency in speaking a language is also supported by self-confidence, Brown (2000:62) States that self-confidence is students' belief that they can do the task or complete it with the abilities they have. It means that a lack of self-confidence causes them to be unsure of what they are doing or dealing with, such as speaking English, of course they will not be fluent in speaking English.

D. Hypothesis of the Research

The study has three hypotheses. In this study using the associative hypothesis, the hypotheses are divided into two; alternative hypotheses (Ha) and null hypotheses (Ho) which will be interpreted as follows:

1. Alternative hypothesis (Ha)

There is a positive correlation between extraversion and speaking ability at the third grade students of MAN 2 Karanganyar.

Null hypotheses (Ho)

There is no correlation between extraversion and speaking ability at the third grade students of MAN 2 Karanganyar.

2. Alternative hypothesis (Ha)

There is a positive correlation between self-confidence and speaking ability at the third grade students of MAN 2 Karanganyar.

Null hypotheses (Ho)

There is no correlation between self-confidence and speaking ability at the third grade students of MAN 2 Karanganyar.

3. Alternative hypothesis (Ha)

There is a positive correlation among extraversion, and self-confidence toward speaking ability at the third grade students of MAN 2 Karanganyar.

Null hypotheses (Ho)

There is no correlation among extraversion, and self-confidence toward speaking ability at the third grade students of MAN 2 Karanganyar.

CHAPTER III

RESEARCH METHODOLOGI

In this chapter, the researcher presents the research methodology. It is consist of the research design, research settings and participants, data sources, data collection, data analysis, and data validation.

A. Research Design

The design used in this study is the correlation of study, Fraenkel et al (2012:331) states that correlation research sometimes called associational research, the relationship among two or more variables are studied without any attempt to influence them. The reason of choosing the method is the research wants to know about the relationship among self-confidence and extraversion toward speaking ability based on correlation coefficient. Other definition from Sugiyono (2013:8) "Quantitative method can be defined as a research method based on the philosophy of positivism, which is used to examine certain populations or samples, collect data using research instruments, and analyze quantitative/statistical data, with the aim of testing established hypotheses."

In research, an important role is research methodology, because the quality of the data depends on it. Cresswell (2012:12) States that in general there are three kinds of research design quantitative research design, qualitative research design and combined research design. The researcher chose a quantitative research design to complete this research because the research problem in this study could be done through a quantitative approach. The strength of this quantitative research method is the short time to collect data, this research is categorized into correlative type. As Gay (1987:230) states that correlational research includes data collection that is used to find out whether, and to what degree, a relationship between two or more variables. There are two kinds of variables this research, extraversion as the dependent variable (X_1) and self-confidence as the dependent variable (X_2) while speaking ability (Y) as the independent variables. Correlation means the tier of two variables vary directly (positive correlation) or inversely (negative correlation). The degree of relationship will express as a numeric index known as the coefficient of correlation.

Everything which is determined by the researcher to be studied so can obtain an information of the cases, than capture conclusion is called as variable Sugiyono (2015:38). There are two kinds of variables in this research which namely as dependent variable and independent variable:

1. Independent Variables

According to Sugiyono (2015:39) variable that influences and becomes the cause or the incidence of the dependent variable is called as independent variable. There are two independent variable of this research:

- a. Self-confidence noted as (X₁)
- b. Extraversion noted as (X_2) .

2. Dependent Variable

According to Sugiyono (2015:39) variable which is influenced or become the result, because of independent variable of this research is speaking ability noted as (Y).

B. Setting of The Research

1. Place of Research

The researcher conducted the research at MAN 2 Karanganyar in the academic year of 2022/2023. MAN 2 Karanyar is located in Tuban, Gondangrejo, Karanganyar, Central Java, 57773

2. Time of Research

Table 3. 1: Research Timeline

No	Activities	Month in 2022/2023							
		Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
1.	Pre-research								
2.	Submission of the Title								
3.	Making Proposal								
4.	Consulting the Proposal								
5.	Conducting examination of the thesis proposal								

6.	Conducting research				
7.	Analyzing and writing the thesis				
8.	Consulting the thesis				
9.	Report and submitted chapter IV and V				

C. Population, Sample and Sampling of the Research

1. Population of the Research

Sugiyono (2015:117), states "population is a generalization area consisting of: objects/subjects that have certain qualities and characteristics that are determined by the researcher to be studied and then draw their conclusions."

The research was carried out at the third grade students of MAN 2 Karanganyar in the academic year of 2022/2023. There are three education program such as Religious Education, IPA and IPS.

2. Sample of the Research

According to Sugiyono, (2015:118) "Sample is part of the number and characteristics of the population." In this study, the samples to be taken were all third grade students of MAN 2 Karanganyar.

3. Sampling

If all the units of population are identical or similar in terms of certain characteristics, it is called homogeneous population Shukla (2020). According to the statement above, this sample can be said to be homogeneous because it has the same classes in English department and also the same level in the second semester. According to Arikunto (2006:134) explains that if the subject is less than 100, it is better to take all. But if the number of subjects is large (more than 100 people) it can be taken between 10-15% or 20-25% or more. The minimum acceptable sample size for a correlational study is considered by most researchers to be no less than 30 Fraenkel, Hyun & Wallen (2012).

In this study, researchers will use simple random sampling where the sample is considered homogeneous, Sugiyono (2015:120) states that taking sample members from the population will be done randomly without paying attention to the strata in the population, There are 210 students at the third grade of MAN 2 Karanganyar. In this study researcher take 20% samples from the population, there are 42 samples from the third grade students of MAN 2 Karanganyar. The steps of selecting the samples were as follows:

- a. Listing all of the students
- b. Writing down the students' code number in software Microsoft Excell
- c. Click the cell that will be assigned a random number.
- d. Generate a random number between 1 210. Then type =RANDBETWEEN(1;210)

D. Technique of Collecting the Data

In this study, the data were taken through documentation and questionnaire. The questionnaire and documentation used to collect the data about self-confidence, extraversion and speaking ability. The Researcher was doing some ways in the data collection procedures, they are as follows:

- 1. Determine the place and the population of the study.
- 2. Ask permission to carry out the study.
- 3. Created research instrument (Questionnaire and documentation)
- 4. The questionnaire and documentation used to collect the data about selfconfidence, extraversion and speaking ability.
- 5. The score obtains from this instrument by using Likert scale.
- 6. Testing normality and linearity.
- 7. Calculating the data by using the correlation "r" product moment to test the hypotheses of the study.
- 8. In addition, the researcher uses SPSS 26 program to calculate the data.

E. Research Instrument

Research Instruments are tools used by researchers to collect research data. Instrument is needed by the researcher to collect the data. "Tool which is used to collecting data for certain purpose is called as research instrument" Periantalo (2016:71). The research instruments used in the research are as follows:

1. Questionnaire

According to Sugiyono (2015:199) questionnaire is a data analysis technique which is done by giving a set of questions or written statements to respondents to answer. Arikunto (2013:42) states a questionnaire is a number of written questions which are used to gain information from respondents about the respondents themselves or their knowledge, believe, etc. There are two types of questionnaires:

a. Opened questionnaire

Opened questionnaire is a type of questionnaire which allows the respondents to fill out the questions using their own sentences.

b. Closed questionnaire

Different from opened questionnaire the respondent can directly choose the appropriate answer.

In this study, researchers used a closed questionnaire. Sugiyono (2015:201) State of each questionnaire that expect answers in the form of the nominal, ordinal, interval, and ratio data, are closed questions. The questionnaire itself is actually written in Indonesia. In order to make it easier

for the respondents to answer the questionnaire, and also the use of Indonesian in the questionnaire will not affect the objectives of the study here. The questionnaire consists of self-confidence & extraversion. The number of respondents in this study were 42 respondents from students in third grade students of MAN 2 Karanganyar. The scoring of the questionnaire in this research is based on the Likert Scale Rating which is interval data. The score range is from 1 to 5.

Tabel 3.2 Interpretation of Correlation Coefficient Value of r

Statement	Option					
Statement	SS	S	N	TS	STS	
Positive	5	4	3	2	1	
Negative	1	2	3	4	5	

Note:

SS	: Sangat Setuju
S	: Setuju
N	: Netral
TS	: Tidak Setuju
STS	: Sangat Tidak Setuju

2. Documentation

Documentation in the form of archives that have been preserved. This documentation is used directly to obtain data from research sites, such as activity reports, magazines, minutes, and documents related to research. This study used documentation instruments to find data on daily test scores in the English subject for class XII students at MAN 2 Karanganyar.

F. Data Validation

Valid and reliable is the part of good research instrument. The validity test was carried out by taking 60 samples at the third grade students of MAN 2 Karanganyar, as stated by Singarimbun & Effendi (1995:33) that the minimum number of questionnaire trials was at least 30 respondents. The research instruments should be valid and reliable to get a valid and reliable result.

1. Validity of the instruments

Validity test is a test procedure to see whether the questions or statements used in the questionnaire can measure correctly or not. According to Arikunto (2006:168) "validity is a measure that indicates the levels of validity of an instrument." Sugiyono (2015:363) States that valid data is "data that does not differ" between the data reported by the researcher and the data that actually occurs on the research object. To know the validity of this instrument researcher will use Pearson product moment, by using the SPSS 26 program. According to Ghozali (2009:49) the basis decision making as follows: If the significance value is less than 0.05 then the question item is valid

If the significance value is greater than 0.05, then the question item is invalid.

a. Validity of Extraversion

The criteria of validity instrument of extraversion become valid if Sig is lower than α and it is invalid if Sig is higher than α . The validity of instrument of extraversion can be seen in the table below.

Item	Sig	α	Result
1.	0.000	0.05	Valid
2.	0.008	0.05	Valid
3.	0.206	0.05	Invalid
4.	0.102	0.05	Invalid
5.	0.248	0.05	Invalid
6.	0.032	0.05	Valid
7.	0.008	0.05	Valid
8.	0.000	0.05	Valid
9.	0.369	0.05	Invalid
10.	0.668	0.05	Invalid
11.	0.041	0.05	Valid
12.	0.146	0.05	Invalid
13.	0.126	0.05	Invalid
14.	0.000	0.05	Valid

27. 0.038 0.05 Valid 28. 0.000 0.05 Valid 29. 0.001 0.05 Valid	26.	0.000	0.05	Valid
28. 0.000 0.05 Valid 29. 0.001 0.05 Valid	27.	0.038	0.05	Valid
29. 0.001 0.05 Valid	28.	0.000	0.05	Valid
	29.	0.001	0.05	Valid

Based on the table of try-out result above indicates from 29 items of students' extraversion 20 items are valid and 9 items are invalid. The invalid numbers cannot use as research instrument.

b. Validity of Self-confidence

The criteria of validity instrument of self-confidence become valid if Sig is lower than α and it is invalid if Sig is higher than α . The validity of instrument of self-confidence can be seen in the table below.

Item	Sig	α	Result
1.	0.499	0.05	Invalid
2.	0.026	0.05	Valid
3.	0.146	0.05	Invalid
4.	0.000	0.05	Valid
5.	0.005	0.05	Valid
6.	0.000	0.05	Valid
7.	0.003	0.05	Valid
8.	0.004	0.05	Valid
9.	0.002	0.05	Valid
10.	0.000	0.05	Valid
11.	0.000	0.05	Valid
12.	0.000	0.05	Valid
13.	0.000	0.05	Valid
14.	0.000	0.05	Valid
15.	0.000	0.05	Valid
16.	0.001	0.05	Valid
17.	0.001	0.05	Valid

Table 3. 4 The Result of Validity test of Self-confidence Instrument.

18.	0.000	0.05	Valid
19.	0.002	0.05	Valid
20.	0.036	0.05	Valid
821.	0.022	0.05	Valid
22.	0.028	0.05	Valid
23.	0.011	0.05	Valid
24.	0.000	0.05	Valid
25.	0.964	0.05	Invalid

Based on the table of try-out result above indicates from 25 items of students' self-confidence 22 items are valid and 3 items are invalid. The invalid numbers cannot use as research instrument.

2. Reliability of the Instruments

"The reliability test aims to see whether the questionnaire has consistency if the measurements are carried out using the questionnaire repeatedly" Aiken (2000:446). In testing the reliability of the instrument, the researcher will use SPSS 26 Statistics software for windows. According to Wiratna Sujarweni (2014:193) explains that the reliability test can be carried out jointly on all items or question items in the research questionnaire. The basis for decision making in the reliability test is as follows:

If the Cronbach's Alpha value is > 0.60 then the questionnaire is declared reliable or consistent.

Meanwhile, if the Cronbach's Alpha value < 0.60, then the questionnaire

is declared unreliable or inconsistent.

a. Reliability of Extraversion

Table 3. 5 The Result of Reliability test of Extraversion

Reliability Statistics			
Cronbach's			
Alpha	N of Items		
.677	29		

It was found that the value of Cronbach's Alpha obtained of reliability of students' extraversion is 0.677. It means that r obtained is higher than r table or 0.677 > 0.60. In conclusion, the instrument is reliable.

b. Reliability of Self-confidence

Table 3. 6 The Result of Reliability test of Self-confidence

Reliability Statistics			
Cronbach's			
Alpha	N of Items		
.774	25		

It was found that the value of Cronbach's Alpha obtained of reliability of students' self-confidence is 0.774. It means that r obtained is higher than r table or 0.774 > 0.60. In conclusion, the instrument is reliable.

G. Technique of Analyzing Data

1. Normality Test

Normality test is used to determine whether the data population is normally distributed or not. Raharjo (2012:109) states "normality test is a method used to test the normality sample." A good regression model is to have a normally distributed residual value." Dahlan (2010:48) the criteria for making a decision on the normality test on SPSS 26 as follows:

If the significance value is greater than 0.05, a decision can be made that the data is normally distributed.

If the significance value is less than 0.05 then the data is not normally distributed.

2. Linearity test

Linearity test is a procedure used to determine whether a research data distribution is linear or not. Priyatno (2010:46) State that "this test will affect the test that will be used next, whether linear or non-linear." in the calculation of linearity test will use the SPSS 26 software for windows program at significance level 0.05. In SPSS 26 this test is called Test for linearity, with linearity test criteria are as follows:

If the value of Sig. deviation from linearity > 0.005, then there is a linear relationship between the independent variable and the dependent variable.

If the value of Sig. deviation from linearity < 0.005, then there is a nonlinear relationship between the independent variable and the dependent variable.

- 3. Hypothesis Testing
 - a. Testing the first and second hypothesis

This study use correlation test to determine the close relationship between the variable extraversion (X_1) toward speaking ability (Y) and correlation between self-confidence (X_2) and speaking ability (Y) at the third grade students of MAN 2 Karanganyar. To measure the relationship between variables, and because the data variables studied is ordinal, Sugiyono (2013:243) "if the data is ordinal, the statistic used is the Spearman Rank Correlation, whereas if the data is interval or ratio, the Pearson Product Correlation is used."

The correlation technique used is the Pearson correlation technique using the product moment correlation formula. Pearson correlation analysis serves to find the magnitude of the relationship and the contribution of the two independent variables (X) to the dependent variable (Y). The choice of product moment correlation statistical technique was because the data were normally distributed. The following is the formula for Product Moment correlation coefficient Sudjana in Purwanto (2011:190).

$$\mathbf{r}_{xy} = \frac{N\Sigma XY - (\Sigma X)(\Sigma Y)}{\sqrt{\{N\Sigma x^2 - (\Sigma x)^2\}\{(N\Sigma y^2 - (\Sigma y)^2\}}}$$

r_{xy}: correlation coefficient

n: many subjects

x: average score of x

y: average score of y

To test the hypothesis, the researcher uses the single correlation technique using the Pearson product formula using SPSS 26 Software for windows, by using a significance value of 0.05. The basis for decisionmaking correlation analysis is by looking at the significance value of the SPSS 26 program output:

If the significance value is < 0.05, then it is correlated.

If the significance value is > 0.05, then there is no correlation.

b. Testing the third hypothesis

The test of third hypothesis used to know the correlation between extraversion, self-confidence toward speaking ability. To test the hypothesis the researcher used multiple correlation by SPSS 26 for windows to test the third hypothesis. The formula is as follows:

$$\mathbf{r}_{xy} = \sqrt{\frac{\frac{ryx_{1^{2}} + ryx_{2^{2}} - 2ryx_{1}ryx_{2}rx_{1}x_{2}}{1 - rx_{1}x_{2^{2}}}}$$

Where:

rx1x2y : The multiple correlation coeficient

rx1y : The correlation coefficient between variable x1 and y

rx2y : The correlation coefficient between variable x2 and y

rx1x2 : The correlation coefficient between variable x1 and x2

Sugiyono (2015: 233)

c. Contribution Distribution

After that, the researcher uses coefficient of determination to calculate the distribution of variable X toward variable Y. The formula as follows:

 $CD = (r)^2 \times 100\%$

CD : the coefficient of determination

R : the coefficient of correlation

To determine the strength of the correlation between the two variables from each of the 3 hypotheses in this study, the conditions for obtaining conclusions are in the following table.

Table 3. 7 Correlation Level

Coefficient Correlation	Level
0.80 to 1.00	Very Strong
0.60 to 0.79	Strong
0.40 to 0.59	Moderate
0.20 to 0.39	Weak
0.00 to 0.19	Very Weak

CHAPTER IV

RESEARCH FINDINGS AND DISCUSSION

A. Research Finding

1. Description of the Data

The data analyze are the results of questionnaires and documentation. Research data is based on questionnaire scores to determine the level of extraversion and students' self-confidence and test to determine speaking ability of third grade students of MAN 2 Karanganyar in the 2022/2023 academic year.

In calculating the data, the researcher was assisted by SPSS 26 for windows to analyze all the data and hypotheses. Presented in the form of mean, median, standard deviation, highest and lowest scores, accompanied by variable descriptions in the form of tables and histograms. Extraversion scores, selfconfidence, and speaking ability can be seen in table 4. 1.

No	Name	Extraversion	Self- confidence	Speaking Ability
1.	Dewi	78	77	65
2.	Felin	67	81	65
3.	Putri	76	99	75

The data research from three variables is summarized below:

Descriptive Statistics								
							Std.	
	Ν	Range	Minimum	Maximum	Sum	Mean	Deviation	Variance
Extraversion	42	39	54	93	3102	73.86	9.169	84.077
Self- confidence	42	32	73	105	3784	90.33	7.482	55.984
Speaking Ability	42	30	60	90	3110	74.05	7.092	50.290
Valid N (listwise)	42							

 Table 4. 2 Variable Data Description

The data obtained, namely extraversion, self-confidence and speaking

ability can be explained as follows:

a. The data of Extraversion

The data of extraversion were collected by using a questionnaire. The maximum score of the test is (93), the minimum score of the test is (54), and the range is (39). The mean (or the average score) and standard deviation are (73.86) and (9.169) respectively. The frequency distribution and the histogram of extraversion can be seen at the table 4. 3 and the figure 4. 1.

Table 4. 3 the Frequency	⁷ Data	of the Score	of Extraversion
--------------------------	-------------------	--------------	-----------------

					Cumulative
		Frequency	Percent	Valid Percent	Percent
Valid	54	1	2.4	2.4	2.4

-	83	5	11.9	11.9	83.3
	84	1	2.4	2.4	88.1
	87	1	2.4	2.4	90.5
	89	1	2.4	2.4	95.2
	93	1	2.4	2.4	97.6
	Total	42	100.0	100.0	100.0

Extraversion

Table 4. 3 above explains about the frequency of extraversion.

Based on the table above, there is one student who got the score 54 and the percentage is 2.4%. There is one student who got the score 58 and the percentage is 2.4%. There is one student who got the score 60 and the percentage is 2.4%. There is one student who got the score 63 and the

percentage is 2.4%. There is one student who got the score 65 and the percentage is 2.4%. There is one student who got the score 66 and the percentage is 2.4%. There are two students who got the score 67 and the percentage is 4.8%. There is one student who got the score 68 and the percentage is 2.4%. There is one student who got the score 69 and the percentage is 2.4%. There are four students who got the score 71 and the percentage is 9.5%. There are two students who got the score 72 and the percentage is 4.8%. There are three students who got the score 75 and the percentage is 7.1%. There are five students who got the score 76 and the percentage is 11.9%. There are two students who got the score 78 and the percentage is 4.8%. There are two students who got the score 79 and the percentage is 7.1%. There is one student who got the score 80 and the percentage is 2.4%. There are two students who got the score 81 and the percentage is 4.8%. There are five students who got the score 83 and the percentage is 11.9%. There is one student who got the score 84 and the percentage is 11.9%. There is one student who got the score 87 and the percentage is 2.4%. There is one student who got the score `89 and the percentage is 2.4%. There is one student who got the score 93 and the percentage is 2.4%.

Extraversion

Figure 4. 1 Histogram of the Score of Extraversion

Frequency data is often effectively displayed by histograms. The data from table 4. 3 is presented as a histogram in Figure 4. 1 above. In this histogram, the vertical dimension of the graph lists the frequency of the scores, and the horizontal dimension ranks the extraversion scores from lowest to highest. The columns are drawn in a graph to match the results of the data calculations.

b. The data of Self-confidence

The data of self-confidence were collected by using a questionnaire. The maximum score of the test is 105, the minimum score is 73, and the range is 32. The mean (or the average score) and standard deviation. are
90.33 and 7.482 respectively. The frequency distribution and the histogram of self-confidence can be seen at the table 4. 4 and the figure 4. 2.

Self-confidence						
		Frequency	Percent	Valid Percent	Cumulative Percent	
Valid	73	1	2,4	2,4	2,4	
	75	1	2,4	2,4	4,8	
	77	1	2,4	2,4	7,1	
	78	1	2,4	2,4	9,5	
	79	1	2,4	2,4	11,9	
	81	2	4,8	4,8	16,7	
	83	1	2,4	2,4	19,0	
	86	1	2,4	2,4	21,4	
	87	4	9,5	9,5	31,0	
	88	3	7,1	7,1	38,1	
	90	3	7,1	7,1	45,2	
	91	4	9,5	9,5	54,8	
	92	2	4,8	4,8	59,5	
	93	3	7,1	7,1	66,7	
	94	1	2,4	2,4	69,0	
	95	3	7,1	7,1	76,2	
	96	3	7,1	7,1	83,3	
	99	4	9,5	9,5	92,9	
	101	1	2,4	2,4	95,2	
	103	1	2,4	2,4	97,6	
	105	1	2,4	2,4	100,0	
	Total	42	100.0	100.0		

Table 4. 4 The Frequency Data of the Score of self-confidence

The table 4. 4 above explains about the frequency of self-confidence.

Based on the table above, there is one student who got the score 73 and the percentage is 2.4%. There is one student who got the score 75 and the

percentage is 2.4%. There is one student who got the score 77 and the percentage is 2.4%. There is one student who got the score 78 and the percentage is 2.4%. There is one student who got the score 79 and the percentage is 4.8%. There are two students who got the score 81 and the percentage is 2.4%. There is one student who got the score 83 and the percentage is 2.4%. There is one student who got the score 86 and the percentage is 2.4%. There are four students who got the score 87 and the percentage is 9.5%. There are two students who got the score 88 and the percentage is 4.8%. There are three students who got the score 90 and the percentage is 7.1%. There are four students who got the score 91 and the percentage is 9.5%. There are two students who got the score 92 and the percentage is 4.8%. There are three students who got the score 93 and the percentage is 7.1%. There is one student who got the score 94 and the percentage is 2.4%. There are three students who got the score 95 and the percentage is 7.1%. There are three students who got the score 96 and the percentage is 7.1%. There are four students who got the score 99 and the percentage is 9.5%. There is one student who got the score 101 and the percentage is 2.4%. There are two students who got the score 103 and the percentage is 4.8%. There are two students who got the score 105 and the percentage is 4.8%.

Figure 4. 2 The Frequency Histogram of the Score of Self-confidence.

Frequency data is often displayed by histograms. The data is from table 4. 4 which is presented as a histogram in Figure 4. 2 above. In this histogram, the vertical dimension on the graph lists the frequency of the scores, and the horizontal dimension ranking ranks the self-confidence scores from lowest to highest. The columns are drawn in a graph to match the results of the data calculations.

c. The data of speaking ability

The data of speaking ability were collected by using documentation. The maximum score is 90, the minimum score is 60, and the range is 30. The mean (or the average score) and standard deviation are 74.05 and 7.092 respectively. The frequency distribution and the histogram of speaking ability can be seen at the table 4. 5 and the figure 4. 3.

	Speaking Ability							
					Cumulative			
		Frequency	Percent	Valid Percent	Percent			
Valid	60	1	2.4	2.4	2.4			
	65	7	16.7	16.7	19.0			
	70	10	23.8	23.8	42.9			
	75	12	28.6	28.6	71.4			
	80	7	16.7	16.7	88.1			
	85	3	7.1	7.1	95.2			
	90	2	4.8	4.8	100.0			
	Total	42	100.0	100.0				

Table 4. 5 The Frequency Data of the Score of Speaking Ability

Based on the table 4.5 above, there is one student who got the score

60 and the percentage is 2.4%. There are saven students who got the score 65 and the percentage is 16.7%. There are ten students who got the score 70 and the percentage is 23.8%. There are twelve students who got the score 75 and the percentage is 28.6%. There are seven students who got the score 80 and the percentage is 16.7%. There are three students who got the score 85 and the percentage is 7.1%. There are two students who got the score 90 and the percentage is 4.8%.

Speaking ability

Figure 4. 3 The Frequency Histogram of the Score of Speaking Ability

The frequency data are often effectively displayed by histogram. The data from table 4. 5 are presented as a histogram in figure 4. 3 above. In this histogram, the vertical dimension on the graph list the frequency of the score, and the horizontal dimension rank order the score of speaking ability from the lowest to the highest. The columns are drawn in the graph to correspond with the result of the computation the data.

- 2. Prerequisite Testing
 - a. Normality Testing

To test the normality distribution of the data, the researcher used Kolmogorov-Smirnov with the help of SPSS 26 for windows. The results of the normality test can be seen in table 4. 6 below.

One-Sample Kolmogorov-Smirnov Test				
	Unstandardized			
	Residual			
Ν	42			
Normal Parameters ^{a,b}	.0000000			
	Std. Deviation	1.27380549		
Most Extreme Differences	Absolute	.092		
	Positive	.092		
	Negative	050		
Test Statistic	· ·	.092		
Asymp. Sig. (2-tailed)	.200 ^{c,d}			
a. Test distribution is Normal.				
b. Calculated from data.				
c. Lilliefors Significance Corr	c. Lilliefors Significance Correction.			

Table 4. 6 The Result of Normality Test

Based on the results of the normality test it is known that the significance value is 0.200 > 0.05, it can be concluded that the residual values are normally distributed

b. Linearity Testing

Linearity test is used to determine whether the relationship between the independent variable and the dependent variable in the form of a straight lines (linear relationship) or not. Here the description of linearity testing:

1) Linearity Testing Extraversion (X_1) and Speaking Ability (Y)

Table 4. 7 Data of Linearity Testing of Extraversion and Speaking

1 **	• • .
ahi	l1fV
uon	LILY

ANOVA Table							
			Sum of		Mean		
			Squares	df	Square	F	Sig.
Speaking	Between	(Combined)	44.510	23	1.935	.917	.583
Ability *	Groups	Linearity	1.231	1	1.231	.584	.455
Extraversion		Deviation	43.278	22	1.967	.933	.567
		from					
		Linearity					
	Within Groups		37.967	18	2.109		
	Total		82.476	41			

The linearity testing from extraversion and speaking ability, that

the value obtained of Sig. deviation is 0.567. Because the significant is higher than 0.05 or 0.567 > 0.05, so the regression between extraversion and speaking ability is linier.

2) Linearity Testing Self-confidence (X₂) and Speaking Ability (Y)

Table 4. 8 Data Linearity Testing of Self-confidence and Speaking

ANOVA Table							
			Sum of		Mean		
			Squares	df	Square	F	Sig.
Speaking	Between	(Combined	36.893	20	1.845	.850	.640
Ability *	Groups)					
Self-		Linearity	15.838	1	15.838	7.297	.013
confidence		Deviation	21.055	19	1.108	.511	.927
		from					
		Linearity					
	Within G	roups	45.583	21	2.171		
	Total		82.476	41			

Ability.

The linearity testing from self-confidence and speaking ability that the value obtained of Sig. deviation is 0.927 Because the significant is higher than 0.05 or 0.927 > 0.05, so the regression between selfconfidence and speaking ability is linier.

3. The Hypothesis Testing

Because the normality and linearity test calculations show that the data are normally distributed and linear regression, the researcher continues to test the three research hypotheses that have been stated in the previous chapter. To test the hypothesis, the researcher used SPSS 26 for windows to analyze the data. Furthermore, an explanation of the instrument correlation is presented in tables 4. 9, 4. 10 and 4. 11 as follows: 1) First Hypothesis

The first hypothesis states that there is a positive relationship between extraversion (X_1) and speaking ability (Y). This hypothesis is an alternative hypothesis (Ha).

Correlations				
			Speaking	
		Extraversion	Ability	
Extraversion	Pearson Correlation	1	122	
	Sig. (2-tailed)		.441	
	Ν	42	42	
Speaking Ability	Pearson Correlation	122	1	
	Sig. (2-tailed)	.441		
	Ν	42	42	

Table 4. 9 The Result of the First Hypothesis

The statistical hypothesis of the first hypothesis:

- a) Ho : $r_{xy} = 0$. It means there is no correlation between X₁ and Y.
- b) Ha : $r_{xy} > 0$. It means there is a positive correlation between X_1 and Y.

The result of the computation above shows that the coefficient of correlation (r) between extraversion (X₁) and speaking ability (Y) with significance level (α) = 0.05 for N = 42 it is found r-obtained is -0.122. It means that r-obtained is lower than r-table (-0.122 < 0.304). Therefore Ha is rejected and Ho is accepted It can be conclude that there is no any significant correlation between extraversion and speaking ability. From the explanation above, it also can be known that speaking ability does not influenced by the extraversion.

2) Second Hypothesis

The second hypothesis says that there is a positive correlation between self-confidence (X_2) and speaking ability (Y). That hypothesis is alternative hypothesis (Ha).

Correlations				
		Self-	Speaking	
		confidence	Ability	
Self-confidence	Pearson Correlation	1	.438**	
	Sig. (2-tailed)		.004	
	Ν	42	42	
Speaking Ability	Pearson Correlation	.438**	1	
	Sig. (2-tailed)	.004		
	Ν	42	42	
**. Correlation is	significant at the 0.01 l	level (2-tailed).		

Table 4. 10 The Result of the Second Hypothesis

The statistical hypothesis of the second hypothesis:

- a) Ho: $r_{xy} = 0$. It means there is no correlation between X_2 and Y.
- b) Ha: $r_{xy} > 0$. It means there is a positive correlation between X_2 and Y.

The result of the computation shows that the coefficient of correlation (r) between self-confidence (X₂) and speaking ability (Y) with significance level (α) = 0.05 for N = 42, it is found r-obtained is 0.438. It means that r-obtained is higher than r-table (0.438 > 0.304). It can be conclude that there is any significant correlation between self-confidence and speaking ability.

The contribution of self-confidence (X₂) and speaking ability (Y) is that $CD = r^2 \ge 100\% = (0.438)^2 \ge 100\% = 19\%$. It means that 19% variance of speaking ability is influenced by students' self-confidence, while 81% is contributed by other factors.

3) Third Hypothesis

The third hypothesis says that there is a positive correlation between extraversion (X_1) , self-confidence (X_2) , and speaking ability (Y). To test the hypothesis, the researcher uses the Multiple Linier Regression Formula with SPSS 26 for windows. How to obtain the result is available in the appendix and the hypothesis test result can be seen in table 4. 11.

Table 4. 11 The Result of the Third Hypothesis

Model Summary ^b									
				Std. Error		Change	e Stati	stics	
		R	Adjusted	of the	R Square	F			Sig. F
Model	R	Square	R Square	Estimate	Change	Change	df1	df2	Change
1	.440 ^a	.193	.152	1.306	.193	4.675	2	39	.015
a. Predictors: (Constant), Self-confidence, Extraversion									
b. Dependent Variable: Speaking Ability									

The statistical hypotheses of the third hypothesis are:

- a) Ho: $r_{x1x2 y} = 0$. It means there is no correlation between (X₁), (X₂), and (Y).
- b) Ha: $r_{x1x2y} > 0$. It means that there is a positive correlation between (X₁),

 (X_2) , and (Y).

The result of the computation shows that the coefficient of correlation (r) between extraversion (X₁), self-confidence (X₂), and speaking ability (Y) with significance level (α) = 0.05 for N = 42. It is found

r-obtained is 0.440. This means that r-obtained is higher than r-table (0.440 > 0.304). It can be conclude that there is any significant correlation between extraversion and self-confidence toward speaking ability.

From the explanation above, it also can be known that the coefficient determination between extraversion (X₁), self-confidence (X₂), and speaking ability (Y) is 0.440. The contribution of extraversion (X₁), self-confidence (X₂), and speaking ability (Y) is $CD = r^2 x 100\% = (0.440)^2 x 100\% = 19\%$. It means that 19% variance of speaking ability is influenced by extraversion and self-confidence, while 81% is contributed by other factors.

B. Discussion

The discussion of the research focuses on the result of hypothesis testing. There are three hypotheses testing in this research is as follows:

a. The first finding of the hypothesis testing shows that there is no positive correlation between extraversion (X₁) and speaking ability (Y). Based on the result product moment correlation analysis, the value of significance testing shows that the correlation between X₁ and X₂ is not significant, because the coefficient of correlation r-obtained is lower than r-table (0.441 > 0.304). From this score it can be seen that extraversion does not contribute to speaking ability. It means there is no positive significant correlation between extraversion and speaking ability at the third grade of MAN 2 Karanganyar in

the academic year of 2022/2023. It also means that the high extraversion will be not followed by the enhancement of speaking ability. When compared with previous research, this research was in line with the research held by Samand, Sailan, & Lio (2019). They also did the research about (analysis on the relationship of extrovert-introvert personality and student speaking performance in English Study Program of Halu Oleo University". He found there is no significant correlation between student personality and their speaking performance. Furthermore Zulhermindra and Vivina Rizali (2022) in "The Correlation Between Student's Personality and Their Speaking Ability", from their research found The result of correlation testing reveals that there is no significant correlation between extrovert personality and their speaking ability r table more (0.18 < 0.396). According to Tuan (2015: 9) there are several factors that influence speaking skills such as: appearance conditions, affective factors, listening skills, topical knowledge, and feedback during speaking activities. Indeed, there are affective factors as stated above, but affective factors are not just a person's personality, there are also many other things such as interests, motivations and attitudes. According to Reves (2018:15 citing Sara's 2013) states that the biggest factor for success in second language learning is motivation. Based on this fact, it is possible that personality has no correlation with speaking ability, it is possible that students' speaking ability is correlated with other factors such as self-confidence, listening ability, or interest. It implies that personality is not an important factor affecting student speaking ability, especially for students of the third grade students of MAN 2 Karanganyar.

b. The second finding of the hypothesis testing shows that there is a positive correlation between self-confidence (X₂), and speaking ability (Y). Based on the result product moment correlation analysis, the value of significance testing also shows that the correlation between self-confidence and speaking ability is significant, because $\rho < \alpha$ (0.438 < 0.304). The coefficient of determination between self-confidence and speaking ability is 19%. It means that 19% speaking ability is influenced by self-confidence and 81% is influenced by other factors. From the scores, it can be known that self-confidence gives contribution to speaking ability. When the students' self-confidence is high, then their speaking ability will be high. it can be known that extraversion gives contribution to speaking ability. According to the results, there was a moderate correlation between self-confidence and speaking ability at the third grade of MAN 2 Karanganyar in the academic year of 2022/2023. When compared with previous research from Muhammad Syahril Rafansah (2020) in "The Correlation Among Self Confidence, Self Esteem and Speaking Achivement at the Third Semester of IAIN Palangkaraya", Syahril Rafansah research found, based on the result of consultation with rtable it proved that rtable = 0.244 and rxy = 0.467, so rxy > rtable. The degree of correlation between two variables score was 0.467. It is categorized as fair correlation. Research conducted by Sumardi et al (2022) in "The Correlation Between Self Confidence and Speaking Ability of the Tenth Grade Students' of SMAN 3 Enrekang" Sumardi

research found, there is a fairly strong relationship between students' speaking skills and self-confidence in tenth grade students of SMAN 3 Enrekang. This shows that there is a relationship between students' self-confidence and their speaking ability.

c. The third finding of the hypothesis testing shows that there is a positive correlation between extraversion (X₁), self-confidence (X₂), and speaking ability (Y). Based on the result multiple correlation analysis by SPSS 26, the coefficient of correlation r-obtained is higher than r-table (0.440 < 0.304). The coefficient of determination between extraversion and self-confidence toward speaking ability is 19%. It means that 19% speaking ability is influenced by extraversion and self-confidence, and 81% is influenced by other factors. From the score, it can be known that extraversion and self-confidence give contribution to speaking ability. When the students' extraversion and self-confidence to the results, there was a moderate correlation between extraversion, self-confidence toward speaking ability at the third grade of MAN 2 Karanganyar in the academic year of 2022/2023.</p>

CHAPTER V

CONCLUSIONS AND IMPLICATION

A. Conclusions

The aim of this study is to know whether there is positive correlation between three variables, namely, extraversion, self-confidence, and speaking ability. Based on the problem statements in previous chapter and the result of the study, it can be concluded that:

- There is no positive significant correlation between extraversion and speaking ability of the third grade of MAN 2 Karanganyar. It means that the improvement of extraversion is not followed by the improvement of speaking ability. This also means that extraversion does not contribute to their speaking ability.
- 2. There is a positive significant correlation between self-confidence and speaking ability of the third grade of MAN 2 Karanganyar. It means that the improvement of self-confidence will be followed by the improvement of speaking ability. It also means that self-confidence has contribution to their speaking ability. The relative contribution of self-confidence to speaking ability is 19% while 81% is contributed by other factors.
- 3. There is a positive significant correlation among extraversion and selfconfidence toward speaking ability at the third grade of MAN 2 Karanganyar. It means that the improvement of students' extraversion and

self-confidence will be followed by the improvement of speaking ability. It also means that the extraversion and self-confidence has distribution to their speaking ability. The relative contribution of extraversion and selfconfidence to speaking ability is 19% while 81% is contributed by other factors.

B. Implication

Based on the research finding, it can be conclude that there is a positive correlation between extraversion, self confidence, toward speaking ability of the third grade students of MAN 2 Karangnyar in the academic year of 2022/2023. A positive correlation means that the improvement of students' extraversion and the higher self-confidence will be followed by the improvement of speaking ability. Based on the research findings and conclusions, it was found that extraversion and self-confidence have contribution in speaking ability, which was 19%. From the results of this study, the implications that can be drawn from this study are that increasing student extraversion and students' self-confidence must be considered to improve their speaking ability. Therefore students need to increase their extraversion and confidence in learning English to improve their speaking ability.

C. Suggestions

Based on the calculation and based on the research that has been done before the researcher present some recommendation as follows:

1. For the teacher

Teachers must realize that self-confidence and extraversion are important in the process of teaching speaking. By knowing the contribution of self-confidence and extraversion to speaking ability, a teacher must create a speaking learning class that is able to increase students' selfconfidence and extraversion.

2. For the students

The second suggestion for students, speaking English as a foreign language can be awkward and embarrassing when practicing it to learn it at school, but after learning it and getting used to it, self-confidence will grow by itself.

3. For other researcher

This study discusses the variables of speaking ability in general. Therefore this research would be useful to determine more specific speaking variables and it would be useful to enrich references.

Appendix 4 The Blue Print of the Research Instrumen of Extroversion (Test)

Appendix 5 Questionnaire of Extraversion (Try out)

Extraversion Questionnaire

Dibawah ini ada beberapa pernyataan (pernyataan 1 sampai 29), pernyataan tersebut bertujuan untuk mendapatkan informasi bagaimana tingkat kepribadian extrovert anda.

Petunjuk Pengisia:

- 1. Lengkapilah data diri anda pada kolom yang tersedia.
- 2. Bacalah secara cermat pernyataan yang telah tersedia.
- 3. Berikan tanda check list (v) pada jawaban yang anda anggap paling benar.
- 4. Jawablah pertanyaan-pertanyaan di bawah ini dengan jujur, sesuai dengan pendapat anda tanpa pengaruh dari orang lain.
- 5. Keterangan:

SS: Sangat Setuju

S: Setuju

:

:

KS: Kurang Setuju

TS: Tidak Setuju

Name

Class

No	Question	1	2	3	4	5
1	Are you talkative person? (apakah anda termasuk orang yang suka/aktif berbicara?)					
2	Are you rether lively? (apakah anda termasuk orang yang cukup menyenangkan dalam sebuah percakapan?)					
3	Do you enjoy meeting new people? (apakah anda menikmati/senang bertemu dengan orang baru?)					
4	Can you usually let yourself go and enjoy yourself at a lively gathering? (biasanya, dapatkah anda pergi dan menikmati sebuah perkumpulan meriah?)					
5	Do you usually take the initiative in making new friends? (apakah anda biasanya mengambil inisiatif dalam membuat teman baru?)					
6	Can you easily get some life into a tether dull gathering? (dapatkah anda dengan mudah menikmati sebuah perkumpulan yang agak membosankan?)					
7	Do you tend to keep in the background on social occasions? (apakah anda cenderung untuk tetap berada di balik layar dari acara-acara sosial?)					
8	Do you like mixing with pople? (apakah anda suka begaul dengan orang-orang?)					
9	Do you like plenty of bustle and excitement around you? (apakah anda menyukai banyak kesubukan dan keramaian di sekitar anda?)					
10	Are you more silent when you are with other people? (apakah anda lebih banyak diam Ketika anda dengan orang lain?)					

	11	Do other pople think of you as being very lively? (apakah orang lain menganggap anda sebagai orang yang menyepangkan?)			
	12	Do other people think that you are a lively and cheerful person? (Apakah orang lain perpiikir bahwa kamu orang yang ramai dan ceria?)			
	13	Can you get a gathering going? (bisakah anda menghadiri sebuah perkumpulan?)			
	14	Do you like to start a conversation with other people? (apakah anda suka memulai percakapan dengan orang lain?)
